

Maxi Vol of can given SA = 5600

You are trying to design a can that maximizes the volume of a right cylinder a.k.a. can.

You are allowed 5600 square cm of sheet metal to create this can.

Things you need to commit to memory

$$SA = CH + 2B = 2\pi r h + 2\pi r^2$$

SA = surface area of cylinder

C = circumference of a circle

r = radius of a circle

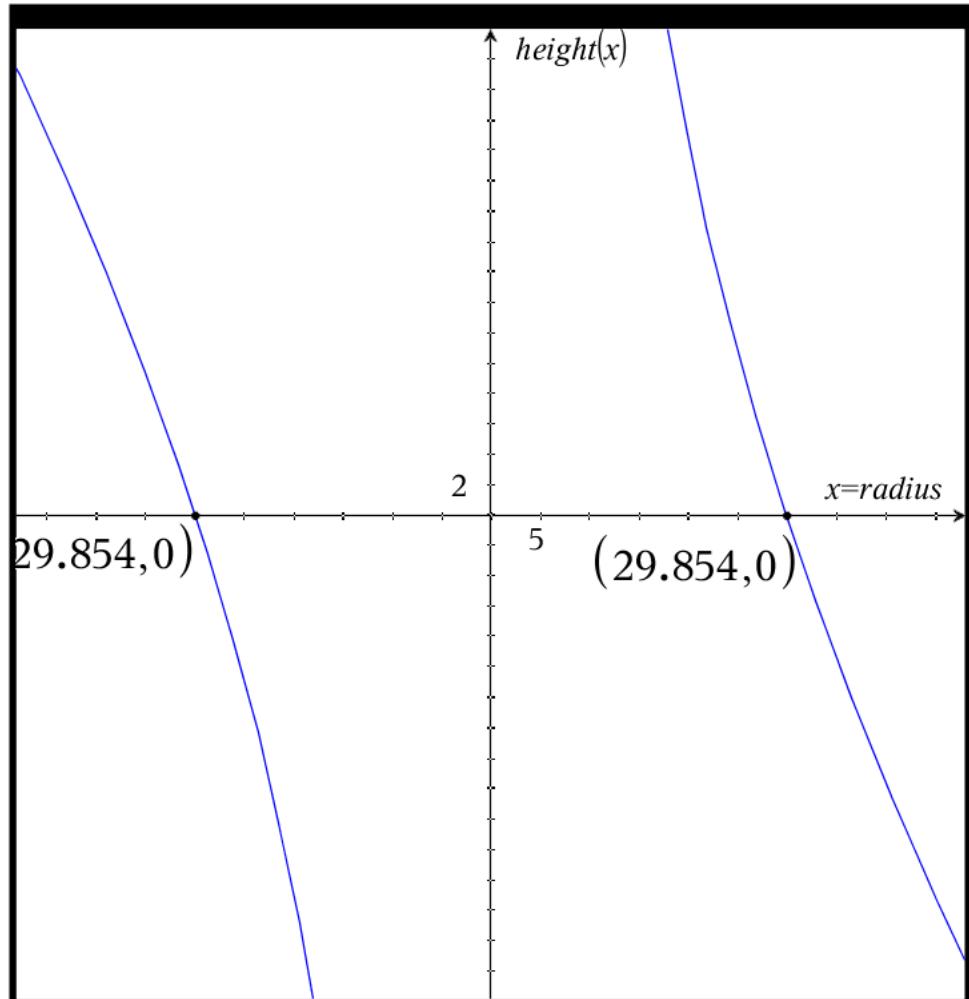

H = height of cylinder

B = Base = circle's area

$$V = BH = 2\pi r^2 \cdot h$$

V = volume of a cylinder

B, H, same as above

$$\begin{aligned}
 5600 &= CH + 2B = 2\pi r h + 2\pi r^2 \\
 5600 &= 2\pi x h + 2\pi x^2 \\
 5600 - 2\pi x^2 &= 2\pi x h \\
 h(x) &= \frac{5600 - 2\pi x^2}{2\pi x} = \frac{5600}{2\pi x} - \frac{2\pi x^2}{2\pi x}
 \end{aligned}$$

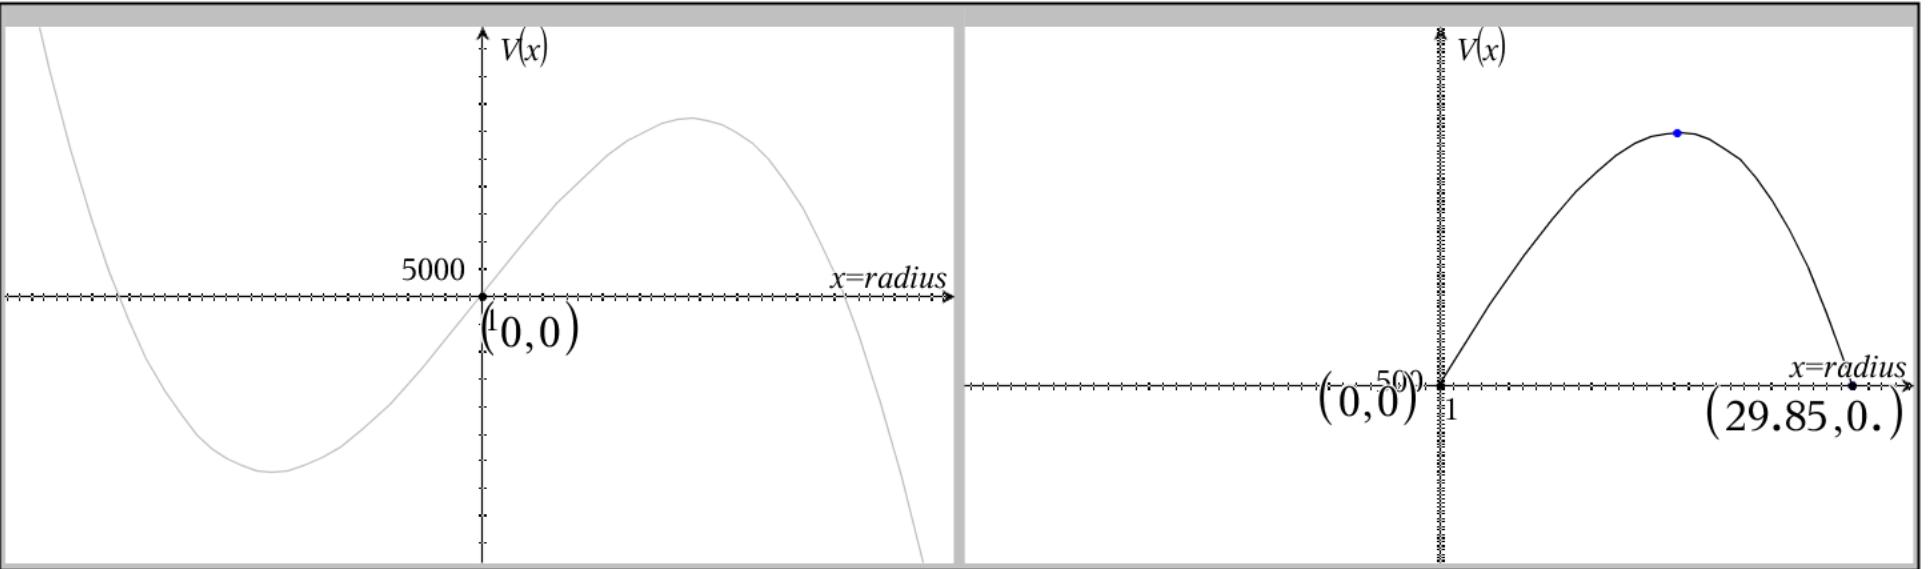

$$h(x) = \frac{2800}{\pi x} - x$$

Feasibility of h

$$0 < h < \sqrt{\frac{2800}{\pi}} \quad 0 < h < 29.854$$

Step 1: Let $x = \text{radius}$ find h in terms of SA and x

Step 2: Determine where h is feasible a.k.a positive

Volume Function = $\pi \cdot r^2 \cdot h$

$$V(x) = \pi \cdot x^2 \cdot \left(\frac{2800}{\pi \cdot x} - x \right)$$

$$V(x) = 2800 \cdot x - \pi \cdot x^3$$

$$V(x) = x \left(2800 - \pi \cdot x^2 \right)$$

Feasible Volume function

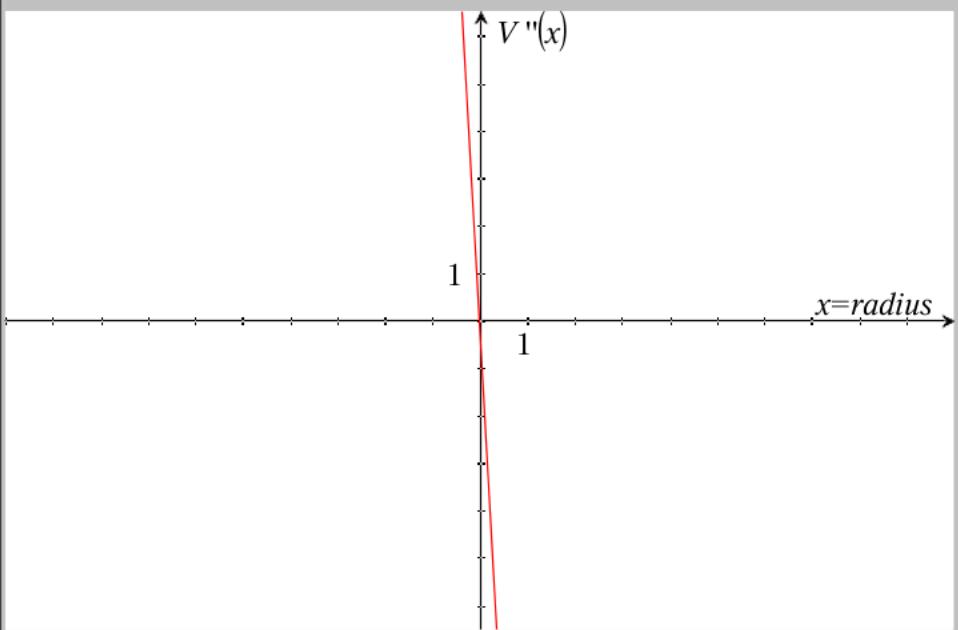

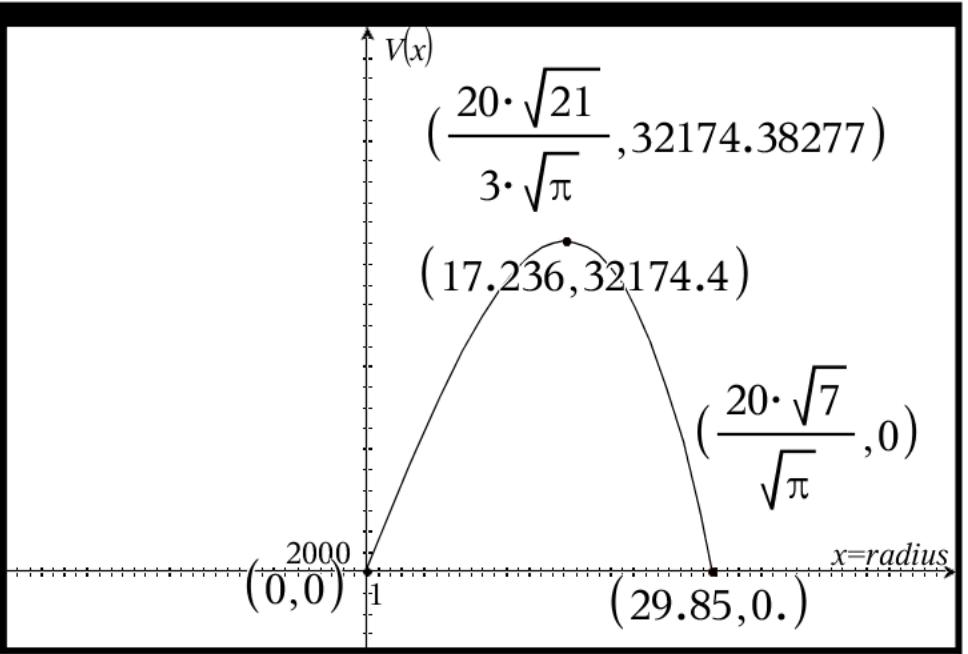

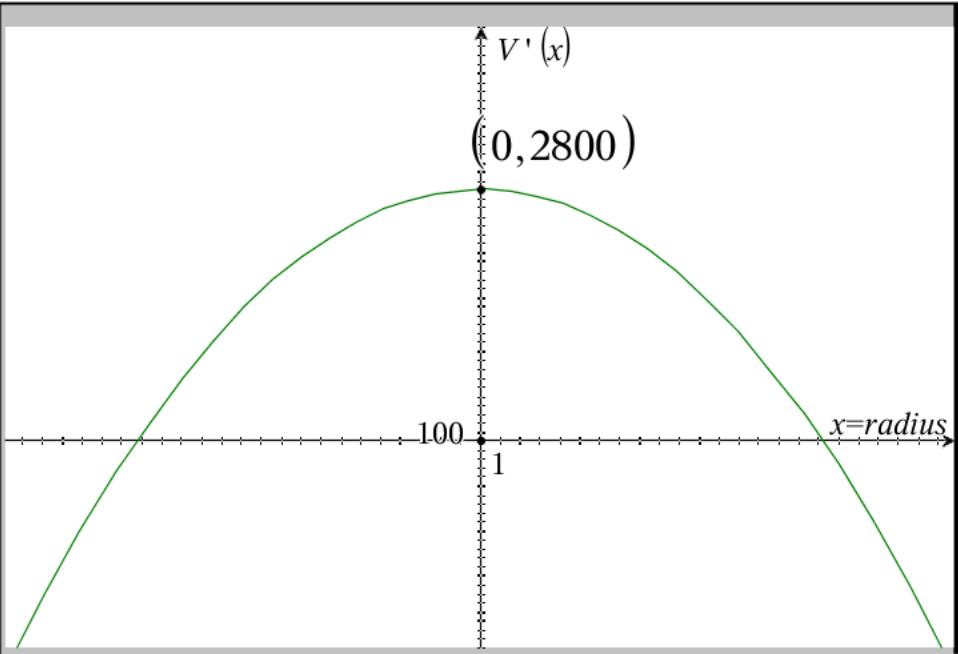

$$V(x) = 2800 \cdot x - \pi \cdot x^3 \text{ for } 0 < x < 29.854$$

Feasible roots of Volume Function

$$x = 0 \quad \text{or} \quad x = \frac{20 \cdot \sqrt{7}}{\sqrt{\pi}} \approx 29.854$$

NOT feasible root of Volume function

$$x = \frac{-20 \cdot \sqrt{7}}{\sqrt{\pi}} \approx -29.854$$

$$\text{Volume Function} = \pi \cdot r^2 \cdot h$$

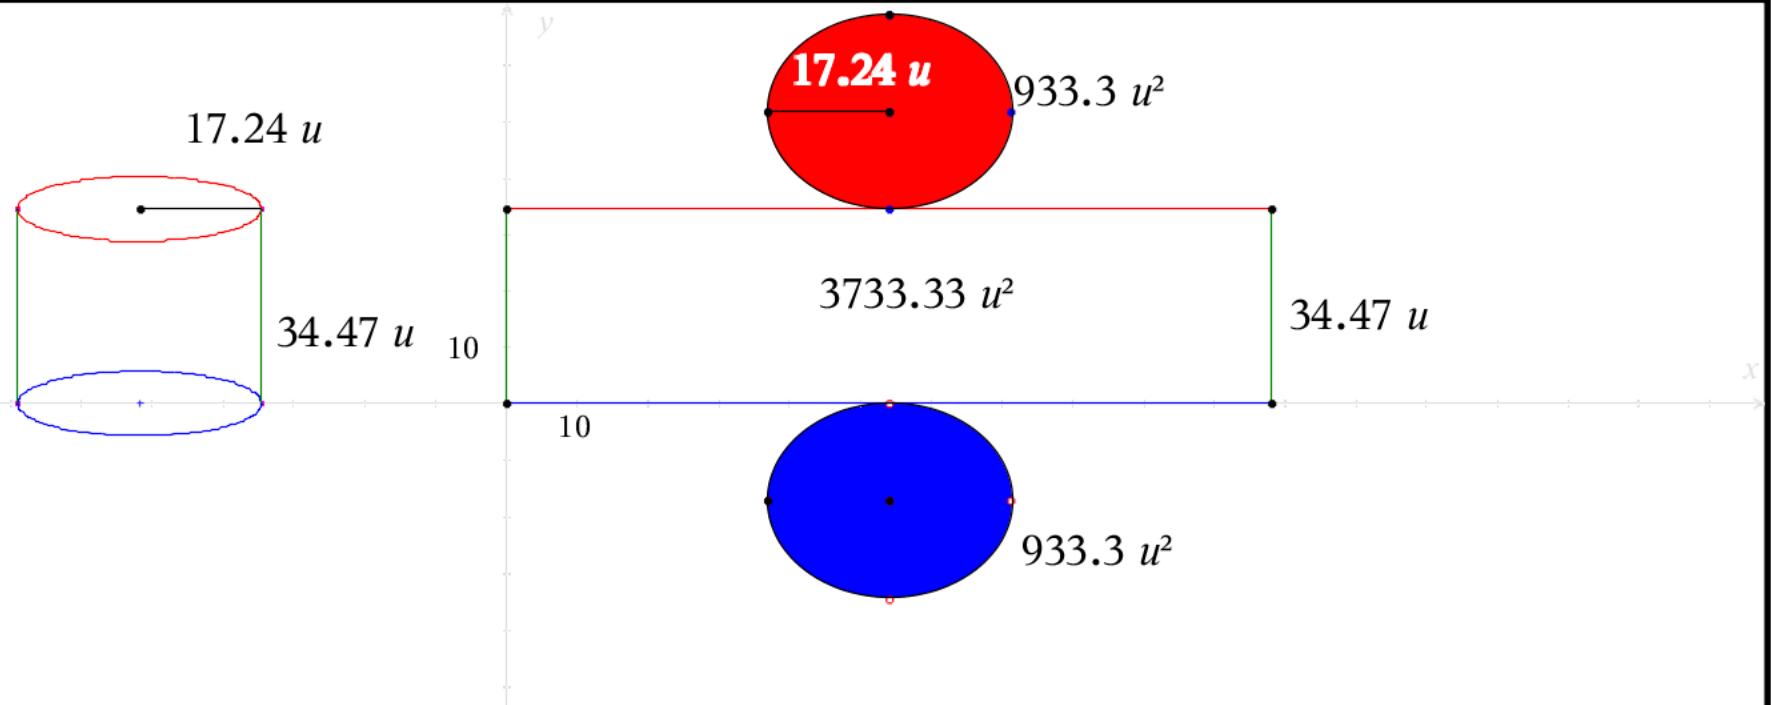

$$V(x) = 2800 \cdot x - \pi \cdot x^3$$

Derivative of Volume function

$$V'(x) = 2800 - 3\pi \cdot x^2$$

2nd Derivative of Volume Function'

$$V''(x) = -6\pi \cdot x$$

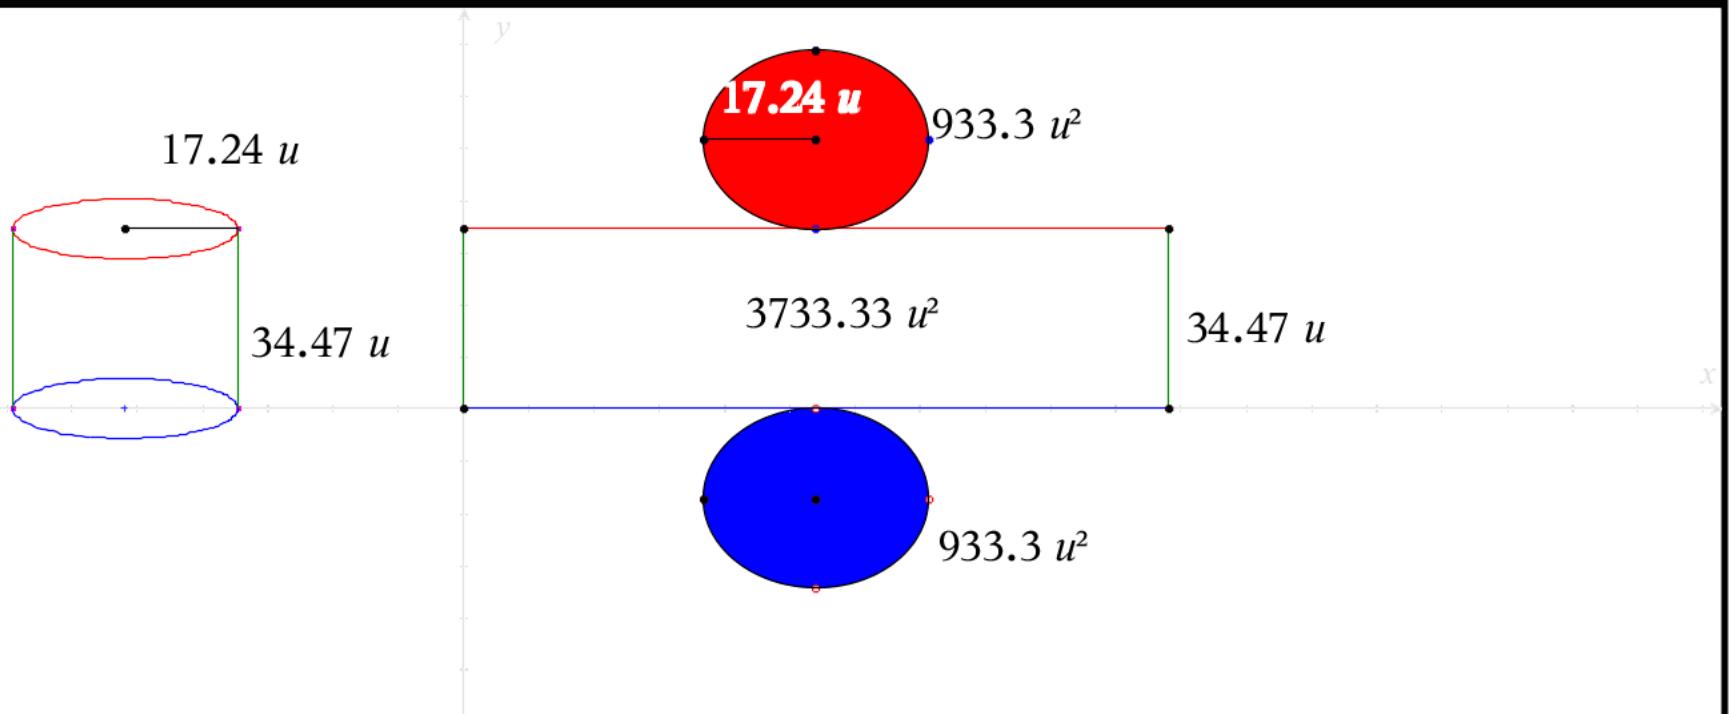

What we found!

The dimensions of the can that maximize volume of a can with surface area = 5600

$$r = x = \sqrt{\frac{5600}{6\pi}} = \frac{20\sqrt{21}}{3\sqrt{\pi}} \approx 17.24$$

$$h = \frac{5600}{2\pi} \cdot \frac{1}{\sqrt{\frac{5600}{6\pi}}} - \sqrt{\frac{5600}{6\pi}} = \frac{40\sqrt{21}}{3\sqrt{\pi}} \approx 34.47$$

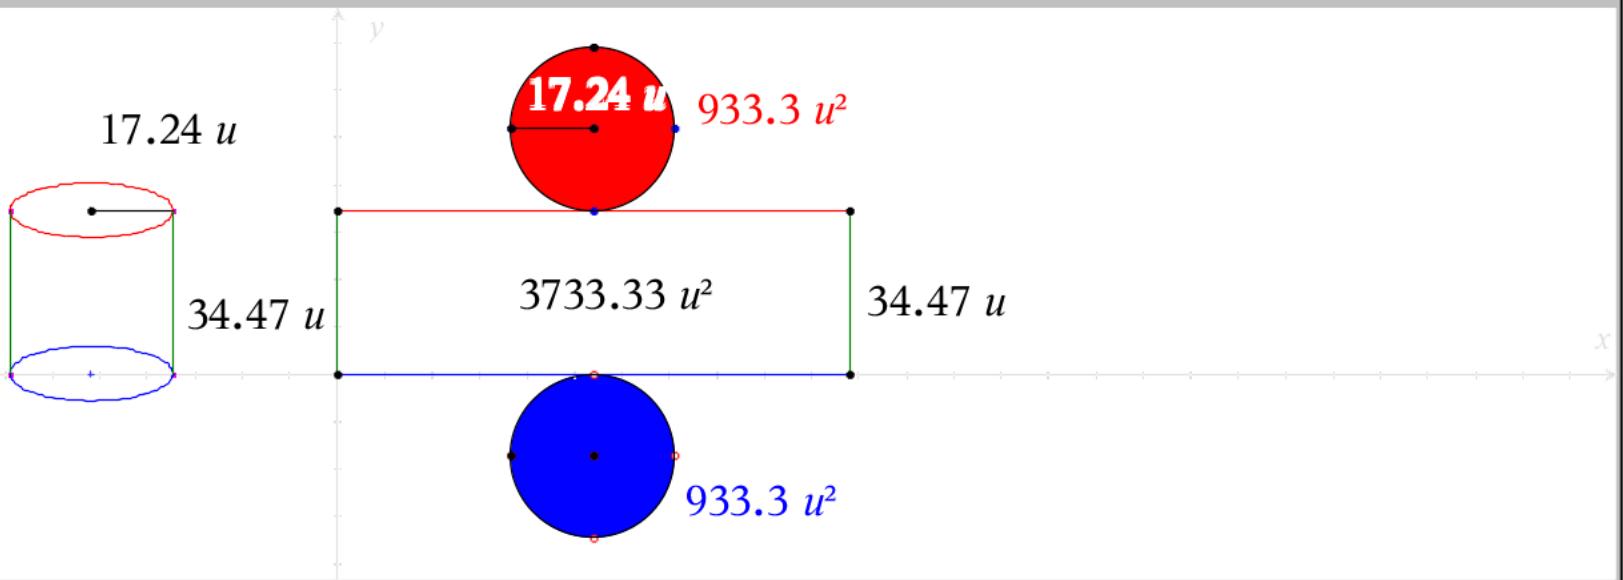

What we found!

The maximum volume of the can that maximize volume of a can with surface area of 5600

Exact Volume	Approximate Volume
3.217e+4	32174.383

$$V = \pi \left(\frac{20 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \right)^2 \left(\frac{40 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \right)$$

$$V = \frac{2800}{3} \cdot \frac{40 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \approx 32174.383$$

What we found! The parts of the can that maximize volume of a can with surface area of 5600

$$\text{radius} = \frac{20 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \approx 17.24$$

$$\text{height} = \frac{40 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \approx 34.47$$

$$\text{Base Area} = \pi \cdot \left(\frac{20 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \right)^2 = \frac{2800}{3} \approx 933.3$$

$$\text{Lateral Area} = 2\pi \left(\frac{20 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \right) \cdot \left(\frac{40 \cdot \sqrt{21}}{3 \cdot \sqrt{\pi}} \right) = \frac{11200}{3} \approx 3733.33$$

$$\text{total surface area} = LA + 2B = \frac{11200}{3} + 2 \left(\frac{2800}{3} \right) = 5600$$
